

Vacation-rental marketplace — production architecture

Read-heavy browse/search served from the edge · strongly consistent booking core · event-driven fan-out · multi-region

SCALING STRATEGY

Where this take-home sits

The clone is the "Web" client's listing page: a static React SPA (Vite) served from a CDN (Vercel). Listing data lives in src/data/listing.js, shaped like the Listing / Reviews / Availability responses a BFF would return, so swapping it for a fetch is a local change. Photo tour and lightbox state is URL-addressable (?modal=PHOTO_TOUR_SCROLLABLE&modalItem=...), which is what lets SSR/ISR render the same overlay deep links and the CDN cache them per URL.
